

Features Removed at SITE's Requirement

SIMF, Saudi International Maritime Forum

SIMF-SCA-002, Version 1.1, 5 September 2026

Companion to the Hosting Decision Brief, SIMF-SCA-001.

Nine capabilities that were promised are removed or reduced because SITE requires it. This document lists them, states the change each one forces on the platform, and gives a recommendation for each. Every reason is either a constraint SITE stated directly or the status SITE recorded on its own technology and methodology checklist.

1. What is removed

Feature promised	Why SITE removes it	What is delivered instead
Sign language avatar. A digital avatar signing each session on screen and on the broadcast, for deaf attendees.	SITE requires no sign language capability.	Nothing. The capability is withdrawn. It was the forum's main accessibility commitment and no replacement is planned.
Live translation. The speaker's voice turned into live subtitles in the viewer's own language during the session.	Artificial intelligence must run on site, and the secure area has no internet access. The proposed service was a cloud service.	Translation after the session, produced by the on-site model and reviewed by the Scientific Committee before attendees see it. Nothing live.
Live transcription. A full written record of each session, produced as it is spoken.	Same. The proposed speech recognition service was a cloud service.	The subtitle track from the published recording, or a transcript supplied by an administrator. Not produced by the platform.
Live video streaming of sessions.	SITE requires no live streaming through the proposed video service.	Sessions published for viewing after they end.
The Google artificial intelligence service, behind the session summary, the assistant and the content filter.	Recorded as rejected on SITE's checklist, on infrastructure restrictions.	The on-site model, which carries all three. This one is a like-for-like replacement rather than a loss.
WhatsApp notifications to attendees.	Recorded as rejected on SITE's checklist, on infrastructure restrictions.	Notifications in the application and by e-mail. The messaging channel is withdrawn.
Three-dimensional interactive venue map, and the route guidance that used it.	The mapping service is a cloud service, and the secure area has no internet access.	A two-dimensional venue map with navigation.
Predictive analytics. Attendance and peak forecasting for planning.	The analytics and machine learning services are cloud services, and the secure area has no internet access.	Figures counted from the platform's own records when a dashboard is opened. Nothing is forecast and nothing is stored as a snapshot.
The user interface design of the website, the Control Panel and the mobile application.	SITE rejected the design and requires the national design system for Saudi government platforms.	A rebuild of all three clients to the standard. This is the only item on this page that moves the launch date.

2. The changes each removal forces

Six of the nine need work. Three need none, and are listed so that nobody spends time on them.

Feature	Change required	Owner	Status
Sign language	Delete the two unused interfaces that remain in the software from this work. Nothing calls them today.	Apexium	Open item already recorded

Feature	Change required	Owner	Status
avatar			
Live translation	No change to the software. Confirm that no communication or marketing material promises translation during a session.	Apexium	To do
Live transcription	Decide who supplies the written record of each session and by when, because the automatic import goes with the video service.	The owner	To do, and it is operational rather than technical
Live video streaming	Publish each recording from the file store after the session, and retire the live path in the Control Panel.	Apexium	To do
The Google service	No change. The on-site model already carries all three capabilities. SITE must be told the item is corrected, because its checklist still records it as rejected.	Apexium	To do
WhatsApp notifications	Remove the channel from the notification layer and from the delivered documents. It is one of four channels and the others are unaffected.	Apexium	To do
Three-dimensional map	No change. The two-dimensional map is already delivered.		Complete
Predictive analytics	No change. What remains open is the list of figures the dashboards show, which is an existing open item.	The owner	Open item OI-03
The interface design	Rebuild the website, the Control Panel, the mobile application and the shared component library to the standard.	Apexium	Blocked until the standard is obtained

3. Recommendations

Two of the nine are worth contesting, one must be sequenced correctly, and six should simply be accepted.

Feature	Recommendation	Reason
Sign language avatar	Put it back to SITE as a request.	It was removed by a requirement rather than by a technical impossibility, it was the forum's only accessibility commitment, and it is the one removal with no replacement at all. If SITE refuses, record the refusal so that the reduction in accessibility is a decision on file rather than an omission.
Live video streaming	Ask SITE whether it can provide streaming from inside its own estate.	If it can, live sessions return with no outbound internet call at all, which is better than the position either side started from. If it cannot, accept publication after the session.
The interface design	Obtain the standard before committing to any date.	This is the only removal that moves the launch date, and the size of the rebuild cannot be estimated until the official distribution and the compliance route are known. A date agreed before that estimate is a guess.
Live translation	Accept.	The delivered documents already state that the platform produces no live translation and claim none, so nothing promised is being withdrawn.
Live transcription	Accept, and name the person responsible.	The capability survives through the on-site model. What changes is that the text arrives by hand rather than automatically, which is a duty someone has to hold for every session.
The Google service	Accept.	The on-site model carries the summary, the assistant and the filter. This is a replacement of equal capability, not a loss.
WhatsApp notifications	Accept.	The application and e-mail channels reach the same attendees, and SMS remains available and approved.
Three-dimensional map	Accept.	A two-dimensional map with navigation meets the need to find a hall inside a venue.
Predictive analytics	Accept.	The actual figures are available on demand. Forecasting was a convenience for planning and nothing in the running of the forum depends on it.

4. Not removed by SITE

Two capabilities are commonly assumed to be casualties of these requirements and are not. SITE approved both on its checklist, so if either is missing from the delivered platform it is a decision of the project rather than a requirement of SITE, and it should not be presented to the Ministry as one.

Capability	SITE's position	Where it stands
SMS notifications	Approved.	The channel exists in the design. Its adapter is not yet built, which is a project decision.
Live push updates to the applications	Approved.	The delivered build carries no live push transport. Screens refresh by asking the server on a timer instead. This is a project decision.

5. What this means for the forum

Three of the nine removals are visible to every attendee: no signing avatar, no live subtitles, and no live video. Together they change what the forum offers its audience on the day, and the accessibility commitment is the one with no replacement at all. The other six are either replaced by something equivalent, as with the artificial intelligence service, or reduced rather than lost, as with the map and the analytics.

One point applies to the whole list. Three items that SITE recorded as rejected are already corrected in the design, being the Google service, the access token lifetime and the session lifetime. SITE has not been told. Its returned checklist still shows all three as failures, so on its own record the platform is further from compliance than it actually is. Re-presenting those three in writing costs nothing and removes three objections.
